ashikurrahman18@gmail.com

Abstract—Main theme of your assignment or academic projects.

n

Index Terms—The word mostly used in your report.

I. INTRODUCTION

Compiler is a software which converts a program written in high level language (Source Language) to low level language. We know a computer is a logical assembly of Software and Hardware. The hardware knows a language, that is hard for us to grasp, consequently we tend to write programs in high-level language, that is much less complicated for us to comprehend and maintain in thoughts. Now these programs go through a series of transformation so that they can readily be used by machines. This is where language procedure systems come handy.

A syntactical error in Java code is one in which the language you use to create your code is incorrect. For example, if you try to create an if statement that doesn't include the condition in parentheses, even when the condition is present on the same line as the if statement, that's a syntax error. CFG stands for context-free grammar. It is a formal grammar which is used to generate all possible patterns of strings in a given formal language.

Parser is a compiler that is used to break the data into smaller elements coming from lexical analysis phase. A parser takes input in the form of sequence of tokens and produces output in the form of parse tree. Parsing is of two types: top down parsing and bottom up parsing. Predictive parser is a recursive descent parser, which has the capability to predict which production is to be used to replace the input string. The predictive parser does not suffer from backtracking.

To accomplish its tasks, the predictive parser uses a look-ahead pointer, which points to the next input symbols. To make the parser back-tracking free, the predictive parser puts some constraints on the grammar and accepts only a class of grammar known as LL(k) grammar.

II. LITERATURE REVIEW

Before this project i read some books which wrote by **Alfred Aho (Author), Monica Lam (Author), Ravi Sethi (Author), Jeffrey Ullman (Author)** and Bangla compiler design book which wrote by **Tamim shahriar subin** .it helps

me a lot ,because before i attend to compiler lab class i don't know how to use FILE,pointer ,Header etc.But my honourable teacher **Khan Md.Hasib** suggest me to basic of c language .and he also helps us to understand this topic.

III. PROPOSED METHODOLOGY

The methodology you work, explain here with code and other items. Syntax is the spelling and grammar of a programming language. Programming languages have rules for spelling, punctuation and grammar, just like the English language. In programming, a syntax error occurs when:

- 1.there is a spelling mistake.
- 2.there is a grammatical mistake.

Types of syntax error More than one type of syntax error may exist. There may be:

- 1.incorrectly spelled statements.
- 2.incorrectly spelled variables.
- 3.missing punctuation (quotes, brackets, etc).

Any one or more of these errors may exist in a program, and each will cause the program to crash or not run at all.

Definition A context-free grammar (CFG) consisting of a finite set of grammar rules is a quadruple (N, T, P, S) where N is a set of non-terminal symbols.

T is a set of terminals where $N \cap T = \text{NULL}$.

P is a set of rules, $P: N \rightarrow (N \cup T)^*$, i.e., the left-hand side of the production rule P does have any right context or left context.

S is the start symbol.

Example

The grammar (A, a, b, c, P, A) , $P: A \rightarrow aA, A \rightarrow abc$.
The grammar (S, a, b, a, b, P, S) , $P: S \rightarrow aSa, S \rightarrow bSb, S \rightarrow \epsilon$
The grammar $(S, F, 0, 1, P, S)$, $P: S \rightarrow 00S \mid 11F, F \rightarrow 00F \mid \epsilon$

parse tree is an ordered rooted tree that graphically represents the semantic information a string derived from a context-free grammar.

Representation Technique

- 1.Root vertex Must be labeled by the start symbol.
- 2.Vertex Labeled by a non-terminal symbol.
- 3.Leaves Labeled by a terminal symbol or

Parsing, syntax analysis, or syntactic analysis is the process of analyzing a string of symbols, either in natural language, computer languages or data structures, conforming to the rules of a formal grammar. The term parsing comes from Latin pars (orationis), meaning part (of speech).

IV. CONCLUSION AND FUTURE WORK

Firstly i learn c basic,pointer,file,structure then i start this project to do. i successfully run it and get the actual output .And hopefully i wil have done the allthis kind of problem solved.

ACKNOWLEDGMENT

I would like to thank my honourable **Khan Md. Hasib Sir** for his time, generosity and critical insights into this project.
